

Aim:

Write a Python program that accepts three different integer numbers from the user and determines which one is the largest among them.

Input Format:

- The input should consist of three integer values entered one per line: the first number, the second number, and the third number.

Output Format:

- The output should display the largest number among the three in the format: "The largest number is: <X>", where *X* is the largest of the three numbers.

Sample Input:

```
Enter first number: 10
Enter second number: 25
Enter third number: 15
```

Sample Output:

```
The largest number is: 25
```

Source Code:

largest_of_three.py

```
a=int(input("Enter first number: "))
b=int(input("Enter second number: "))
c=int(input("Enter third number: "))
if(a>b):
    if(a>c):
        print("The largest number is:",a)
    else:
        print("The largest number is:",c)
else:
    if(b>c):
        print("The largest number is:",b)
    else:
        print("The largest number is:",c)
```

Execution Results - All test cases have succeeded!

Test Case - 1
User Output
Enter first number:
10
Enter second number:
20

Enter third number:
30
The largest number is: 30

Test Case - 2
User Output
Enter first number:
99
Enter second number:
12
Enter third number:
35
The largest number is: 99
